

# Equatorial Sea Level Rise

*what drives it and why it matters*

AM10 – Data Visualization, Study Group 3

**Sea level rise (SLR)** has been considered one of the most severe impacts of climate change. Observations show that global mean sea level is on the rise, with rate accelerating in recent years.<sup>1</sup>

### Problem Statement

What are the **drivers** and **implications** of SLR?

#### Drivers

- 1 Thermal Expansion
- 2 Polar Ice Melting

(National Geographic, 2019)

#### Implications

- 1 GDP
- 2 Land
- 3 Population

# Ocean Temperatures have spiked globally

## Drivers of Sea Level Rise

**Thermal Expansion:** Sea Levels are rising as ocean surface temperatures warm up and expand in volume. <sup>1</sup>

### Average Annual Sea Surface Temperature Anomaly - By Region

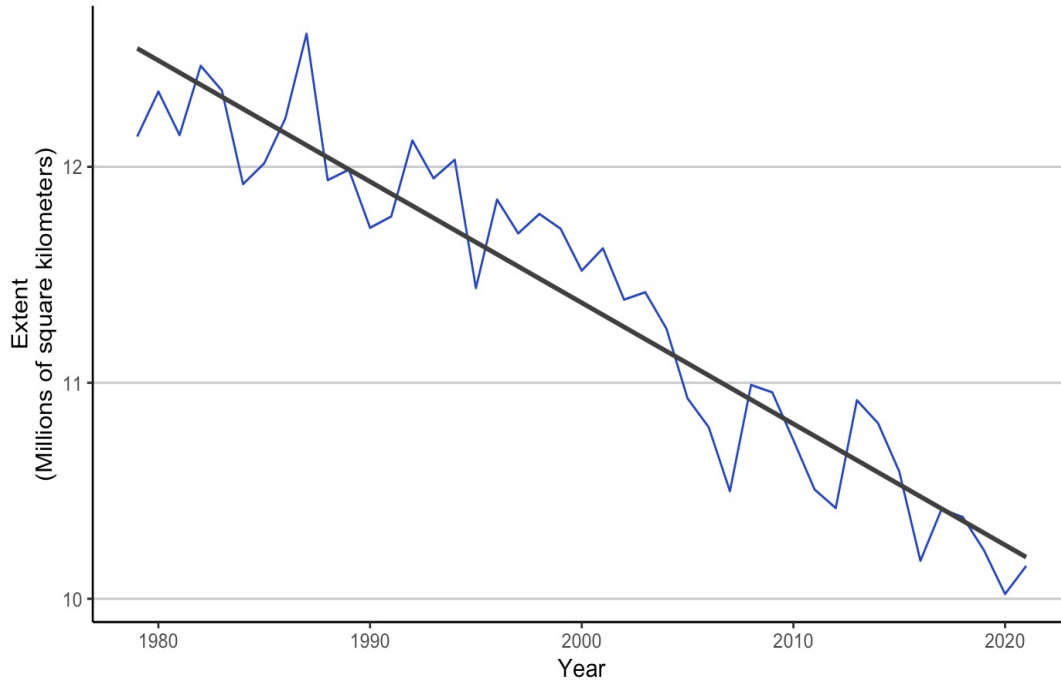

- 1 Positive temperature anomalies indicate observed temperature is warmer than the baseline
- 2 1977 is the beginning of high ocean temperatures, affecting mostly the Northern Hemisphere
- 3 Warming of ocean surface caused roughly 1/3 of global sea level rise since 2004

The plot of median of Annual Sea Surface Temperature Anomaly for years 1850-2021, relative to the average temperature from 1961-1990. Color shows details about Entity. The view is filtered on Entity, which keeps Northern Hemisphere, Southern Hemisphere, Tropics and the World.

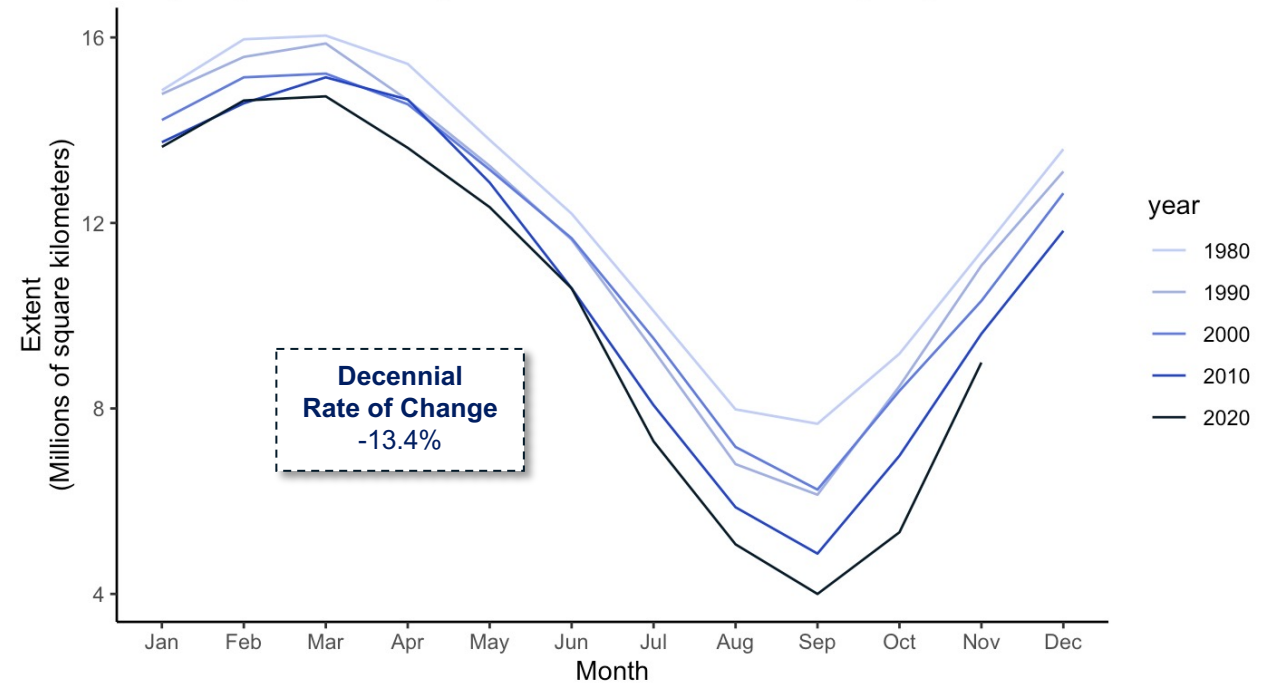

# Polar warming has wiped out ice extent

Drivers of Sea Level Rise

**Average Arctic Sea Ice Extent**

**Annual Arctic Sea Ice Trend**

- 1 Arctic Ice Extent has decreased by ~ 30%
- 2 Seasonal consistency
- 3 Ice Extent/Volume ↓ Sea Level Rise ↑

# The future of Sea Level Rise

Driver analysis and prediction

## Key Driver Analysis

### Linear Regression Model<sup>1</sup>

Variable	Estimate (mm)	P-Value
Temperature Anomaly (C°)	65.408	< 2e-16 ***
Sea Ice Extent Anomaly (M Km <sup>2</sup> )	-14.734	7.41e-11 ***

R <sup>2</sup>	84%
Adjusted R <sup>2</sup>	83.8%
Number of observations	168

Thermal Expansion

Ice Extent

SLR

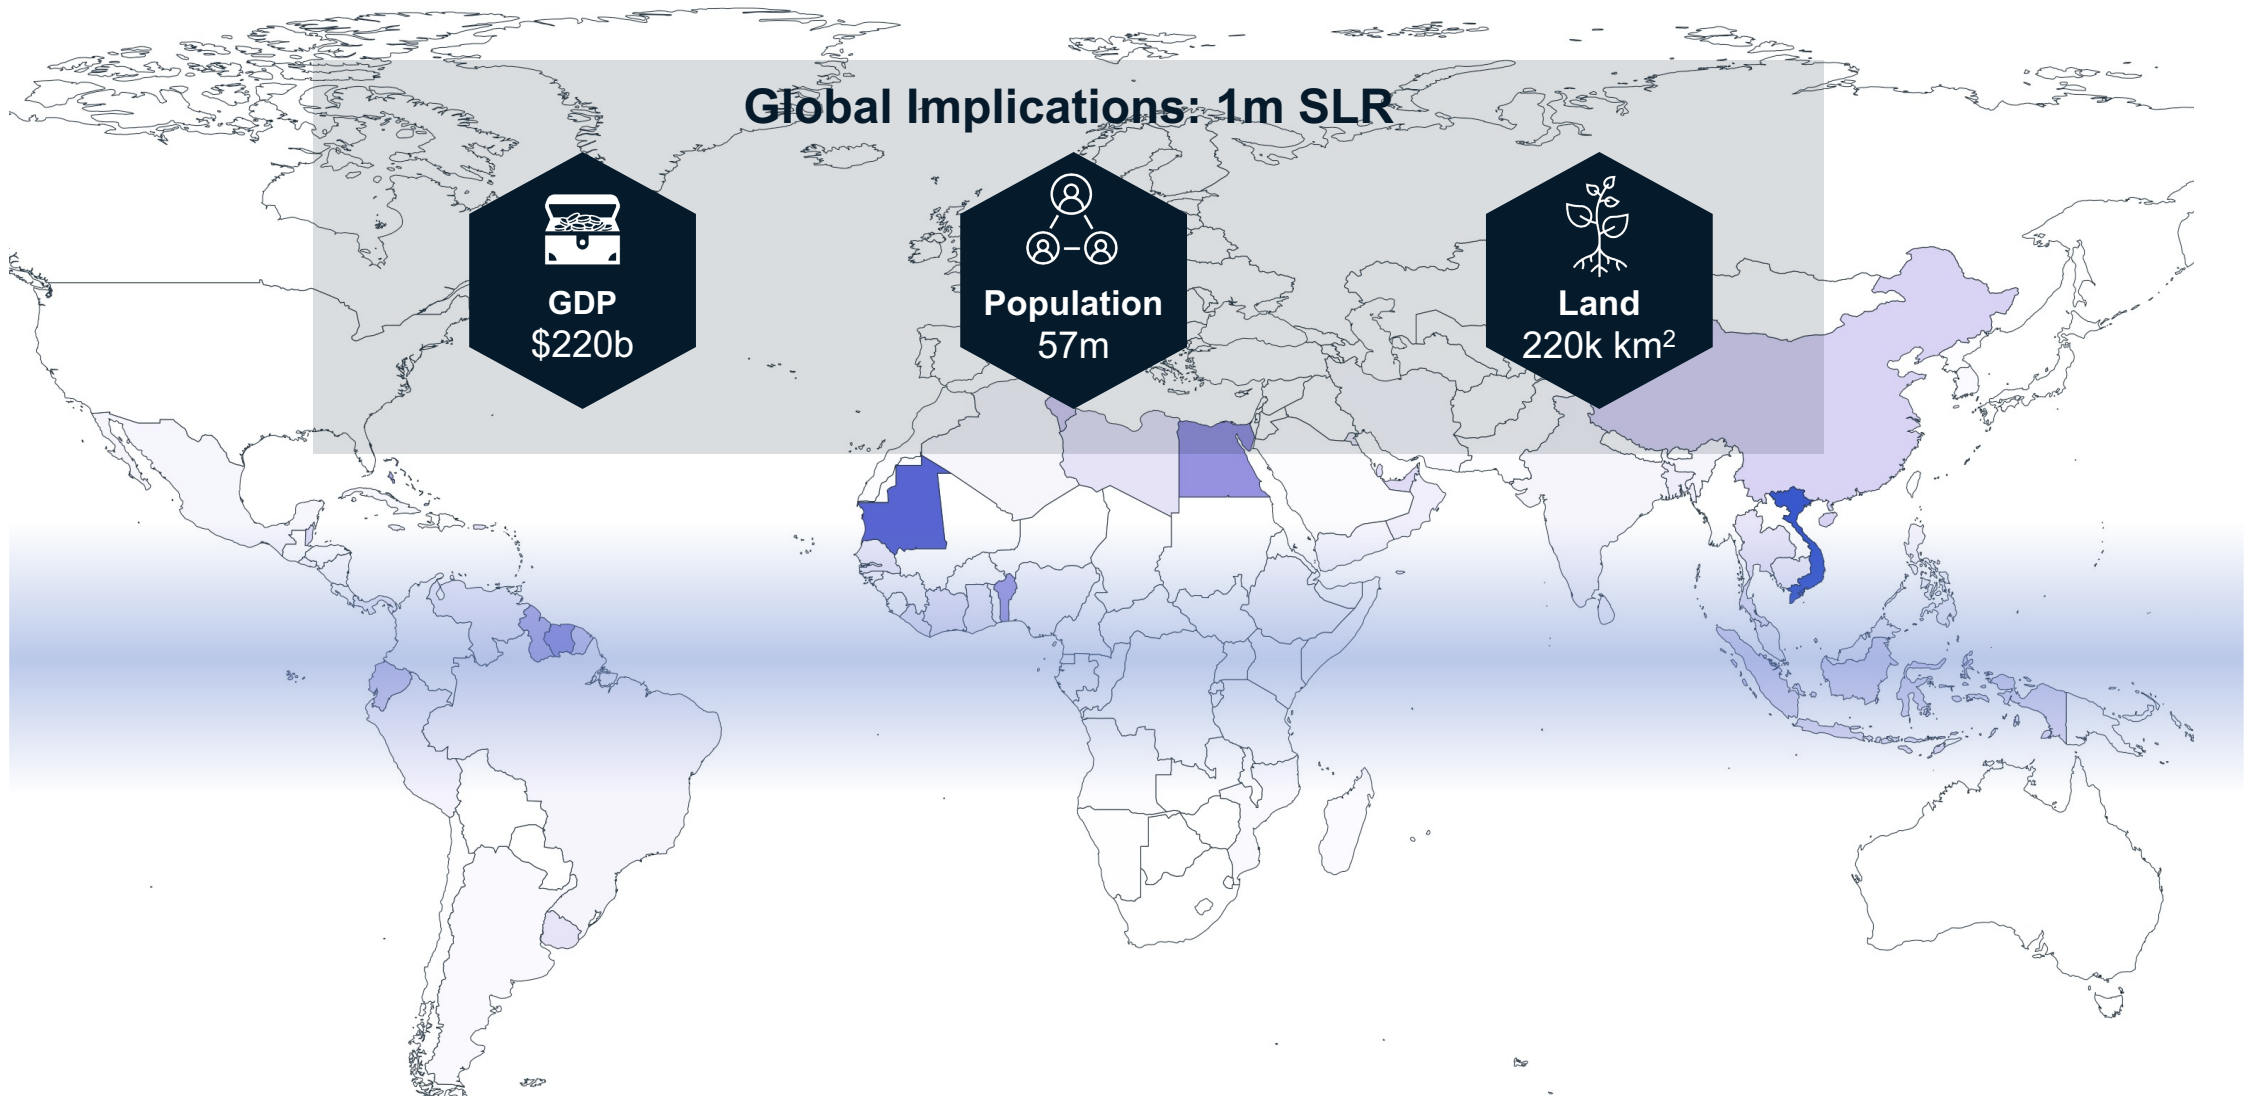

## Time Series Decomposition & Prediction

### Decomposition of additive time series

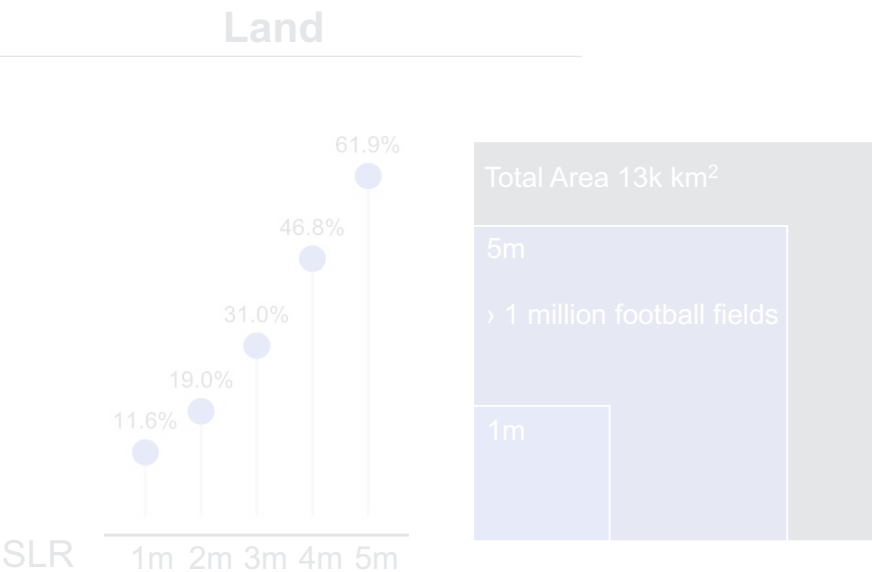

- 1 There is a **clear increasing** trend in sea level
- 2 Monthly average sea level has obvious **seasonal characters**
- 3 **HoltWinters:** Sea level will increase by **1 m** by **2120** in 95% confidence interval upper level

## Population

## Land

## GDP

## SLR

### Latin America

### South East Asia

### Sub-Saharan Africa

# Conclusion

## Key Takeaways and Limitations

### What drives it

#### Thermal Expansion

2020 witnessed 0.7C rise in sea surface temperature

#### Polar Ice Melting

Average Arctic Sea Ice Extent has decreased

### Why it matters

#### If trends continue...

57m people affected

220k km<sup>2</sup> land flooded

100

Sea level will rise by 1m

## Limitations

1

Limited confidence about prediction due to insufficient historical data of key drivers

2

Overlooking critical implications due to analysis of only two main drivers
